Key Concepts and Theorems in Chapter 12 with Sample Problems

Properties of Circles

- Radius and Diameter: The radius is the distance from the center to any point on the circle; the diameter passes through the center, with length twice the radius.
- Chord: A segment with both endpoints on the circle.
- Tangent: A line that touches the circle at exactly one point, perpendicular to the radius at the point of contact.
- Secant: A line that intersects the circle at two points.

Major Theorems and Definitions

- **Inscribed Angle Theorem:** An inscribed angle is half the measure of its intercepted arc.
- **Central Angle Theorem:** The measure of a central angle equals the measure of its intercepted arc.
- **Angles Formed by a Tangent and a Chord:** The measure of the angle is half the measure of the intercepted arc.
- **Chord-Chord Angles:** The angle formed outside the circle by two intersecting chords equals half the difference of the intercepted arcs.
- **Secant-Secant and Secant-Tangent Angles:** These angles are related to the measures of intercepted arcs and segments.

Sample Problem and Solution

Problem:

In a circle, a tangent and a chord intersect at point P outside the circle. If the measure of the angle formed between the tangent and the chord is 40° , find the measure of the intercepted arc.

Solution Steps:

- Recognize that the angle between a tangent and a chord is half the measure of the intercepted arc.
- Set up the equation:

$$\text{Angle} = \frac{1}{2} \times \text{Arc measure}$$

$$40^\circ = \frac{1}{2} \times \text{Arc measure}$$

- Solve for the arc measure:

Arc measure = $2 \times 40^\circ = 80^\circ$

- Answer: The intercepted arc measures 80° .

This sample illustrates how understanding the theorems simplifies problem-solving, which can be cross-verified with the answer sheet.
