Introduction to the Equation of a Circle

What Is a Circle in Geometry?

A circle is a set of all points in a plane that are equidistant from a fixed point called the center. The distance from the center to any point on the circle is known as the radius.

Standard Form of the Equation of a Circle

The most common form used in equations of circles is the standard form:

$$(x - h)^2 + (y - k)^2 = r^2$$

where:

- (h, k) = coordinates of the center of the circle
- r = radius of the circle

Components of the Equation of a Circle

Center and Radius

The standard form clearly indicates the center and radius, which are crucial for graphing and analyzing the circle.

Deriving the Equation from the Graph

Given the graph of a circle, you can find its center and radius and then write the equation

accordingly.

Types of Equations of Circles in Worksheets

Standard Form

This form is straightforward and easy to interpret, often used in worksheets for initial learning.

General Form

$$Ax^2 + By^2 + Cx + Dy + E = 0$$

When working with equations in general form, students often need to convert them into standard form for better understanding.

Key Differences and Conversion

- Standard form explicitly shows the center and radius.
- General form may require completing the square to convert into standard form.

Working with Equations of Circles: Tips and Strategies

Converting from General to Standard Form

To analyze or graph a circle, it's often necessary to convert the general form to the standard form via completing the square.

- Group x and y terms separately.
- Complete the square for both x and y terms.
- Rewrite the equation in standard form to identify the center and radius.

Finding the Center and Radius

- **Center:** (h, k) from the standard form.
- **Radius:** $r = \sqrt{\text{the constant term after completing the square}}$.

Sample Worksheet Problems and Solutions

Problem 1: Write the equation of a circle with center at (3, -2) and radius 5.

Solution: Using the standard form:

$$(x - 3)^2 + (y + 2)^2 = 25$$

Problem 2: Convert the general form $4x^2 + 4y^2 - 8x + 16y + 12 = 0$ into standard form.

Solution:

- Divide entire equation by 4 to simplify: $x^2 + y^2 - 2x + 4y + 3 = 0$
- Group x and y terms: $(x^2 - 2x) + (y^2 + 4y) = -3$
- Complete the square:
 - $x^2 - 2x = (x - 1)^2 - 1$
 - $y^2 + 4y = (y + 2)^2 - 4$
- Rewrite the equation: $(x - 1)^2 - 1 + (y + 2)^2 - 4 = -3$
- Combine constants: $(x - 1)^2 + (y + 2)^2 = 2$

Thus, the standard form is

$$(x - 1)^2 + (y + 2)^2 = 2, \text{ with center at } (1, -2) \text{ and radius } \sqrt{2}.$$
