QuestionAnswer What are the main differences between plant and animal cells as explained in CBSE Class 10 Biology? Plant cells have a cell wall, chloroplasts, and a large central vacuole, whereas animal cells lack cell walls and chloroplasts and have smaller vacuoles. Plant cells are generally rectangular, while animal cells are irregular in shape. What is the process of photosynthesis as per CBSE Class 10 Biology syllabus? Photosynthesis is the process by which green plants prepare their food using sunlight, carbon dioxide, and water, producing glucose and oxygen. It occurs mainly in the chloroplasts of leaf cells. How does the circulatory system function in humans as covered in Class 10 Biology? The human circulatory system consists of the heart, blood, and blood vessels. It transports oxygen, nutrients, hormones, and waste products throughout the body, with the heart pumping blood through arteries and veins. What are the different types of respiration discussed in Class 10 CBSE Biology? The main types of respiration are aerobic respiration, which requires oxygen and produces maximum energy, and anaerobic respiration, which occurs without oxygen and produces less energy along with byproducts like lactic acid or alcohol. Explain the concept of adaptation in plants and animals as per CBSE Class 10 Biology. Adaptation refers to the structural, functional, and behavioral features that help plants and animals survive in their specific environments. For example, cactus plants have thick stems to store water, and polar bears have thick fur for insulation. What is the significance of the digestive system in humans as taught in Class 10 Biology? The digestive system breaks down food into simpler substances that can be absorbed into the bloodstream. It includes organs like the mouth, esophagus, stomach, intestines, liver, and pancreas, functioning to provide energy and nutrients. Describe the process of excretion in humans as per CBSE Class 10 Biology. Excretion involves removing metabolic waste products from the body. In humans, the primary excretory organs are kidneys, which filter blood to produce urine containing urea, salts, and water. What are the functions of the nervous system in humans according to Class 10 Biology? The nervous system coordinates the body's activities by transmitting signals between different parts. It includes the brain, spinal cord, and nerves, controlling movements, sensations, and responses to stimuli. How are viruses different from bacteria, based on Class 10 Biology? Viruses are tiny infectious agents that cannot reproduce on their own and require a host cell, whereas bacteria are single-celled organisms that can live and reproduce independently. Viruses are generally smaller and cause various diseases. What is the importance of biodiversity as taught in CBSE Class 10 Biology?
