Common Types of Questions and Their Corresponding Answers

A detailed review of typical questions helps students anticipate what to expect and understand how answers are derived.

1. Algebraic Equations and Simplification

Sample Question:

Solve for x : $3x^2 - 5x + 2 = 0$.

Answer & Explanation:

This quadratic equation can be solved using the quadratic formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

where $a=3$, $b=-5$, and $c=2$.

Calculations:

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4 \times 3 \times 2}}{2 \times 3} = \frac{5 \pm \sqrt{25 - 24}}{6} = \frac{5 \pm \sqrt{1}}{6}$$

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4 \times 3 \times 2}}{2 \times 3} = \frac{5 \pm \sqrt{25 - 24}}{6} = \frac{5 \pm \sqrt{1}}{6}$$

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4 \times 3 \times 2}}{2 \times 3} = \frac{5 \pm \sqrt{25 - 24}}{6} = \frac{5 \pm \sqrt{1}}{6}$$

Thus, the solutions are:

[

$$x = \frac{5 + 1}{6} = 1 \quad \text{and} \quad x = \frac{5 - 1}{6} = \frac{4}{6} = \frac{2}{3}$$

]

Final Answer: $x = 1$ or $x = \frac{2}{3}$.

2. Function Analysis and Graphs

Sample Question:

Given $f(x) = 2x^3 - 3x^2 - 12x + 5$, identify the critical points and determine their nature.

Answer & Approach:

- Find the first derivative:

[

$$f'(x) = 6x^2 - 6x - 12$$

]

- Set $f'(x) = 0$ to find critical points:

[

$$6x^2 - 6x - 12 = 0 \Rightarrow x^2 - x - 2 = 0$$

]

- Solve quadratic:

[

$$x = \frac{1 \pm \sqrt{1 + 8}}{2} = \frac{1 \pm 3}{2}$$

\]

which gives:

\[

$$x = 2 \quad \text{or} \quad x = -1$$

\]

- Determine the nature of each critical point via second derivative:

\[

$$f''(x) = 12x - 6$$

\]

- At $(x=2)$:

\[

$$f''(2) = 24 - 6 = 18 > 0 \rightarrow \text{local minimum}$$

\]

- At $(x=-1)$:

\[

$$f''(-1) = -12 - 6 = -18$$

\]

Answer Summary:

- Critical points at $(x=2)$ (minimum) and $(x=-1)$ (maximum).

3. Exponential and Logarithmic Functions

Sample Question:

Solve for x : $3^{2x} = 81$.

Answer & Solution:

Express 81 as a power of 3: $81 = 3^4$.

So,

[

$$3^{2x} = 3^4$$

]

Set exponents equal:

[

$$2x = 4 \rightarrow x = 2$$

]

Final Answer: $x = 2$.

4. Systems of Equations

Sample Question:

Solve the system:

[

$\begin{cases}$

$$x + 2y = 7$$

$$3x - y = 2$$

\end{cases}

\]

Answer & Solution:

Use substitution or elimination. Using elimination:

Multiply the first equation by 1:

\[

$$x + 2y = 7$$

\]

Multiply the second equation by 2:

\[

$$6x - 2y = 4$$

\]

Add the two:

\[

$$(x + 2y) + (6x - 2y) = 7 + 4 \rightarrow 7x = 11 \rightarrow x = \frac{11}{7}$$

\]

Substitute into the first original equation:

\[

$$\frac{11}{7} + 2y = 7 \rightarrow 2y = 7 - \frac{11}{7} = \frac{49}{7} - \frac{11}{7} = \frac{38}{7}$$

\]

\[

$$y = \frac{19}{7}$$

\]

Answer: $\left(x = \frac{11}{7} \right), \left(y = \frac{19}{7} \right)$.
