- Properties of Isosceles and Equilateral Triangles
- Applying the Pythagorean Theorem
- Finding Missing Side Lengths and Angles
- Using Geometric Postulates and Theorems to Solve Problems

Understanding these core themes helps in tackling Practice B questions effectively.

Common Types of Practice B Questions and Their Solutions

Practice B questions typically test your understanding of the concepts through a variety of problem types. Here, we explore some of the most common questions and their detailed solutions.

1. Proving Triangle Congruence

Sample Question:

Given two triangles with two pairs of equal sides and the included angles equal, prove that the triangles are congruent.

Solution Steps:

- Identify the given data: Two sides and the included angle are equal in both triangles.
- Determine the appropriate congruence criterion: SAS (Side-Angle-Side).
- Apply the SAS Postulate: Since two sides and the included angle are equal, the triangles are congruent.
- State the conclusion explicitly: Therefore, the two triangles are congruent.

Tip: Practice identifying the correct congruence criterion based on given data in each problem.

2. Finding Missing Sides Using the Pythagorean Theorem

Sample Question:

In a right triangle, one leg measures 7 units, and the hypotenuse measures 25 units. Find the length of the other leg.

Solution Steps:

- Recall the Pythagorean theorem: $(a^2 + b^2 = c^2)$.
- Substitute known values: $(7^2 + b^2 = 25^2)$.
- Calculate: $(49 + b^2 = 625)$.
- Isolate (b^2) : $(b^2 = 625 - 49 = 576)$.
- Find (b) : $(b = \sqrt{576} = 24)$.

Answer: The other leg measures 24 units.

3. Using Congruence Criteria to Find Missing Angles

Sample Question:

In triangle ABC, side AB equals side AC. Find the measure of angle BAC if angles ABC and ACB are 65° and 50° , respectively.

Solution Steps:

- Recognize that $AB = AC$ indicates an isosceles triangle with base BC.
- Use the triangle sum theorem: sum of angles in triangle ABC is 180° .

- Calculate angle BAC: $(180^\circ - 65^\circ - 50^\circ = 65^\circ)$.
- Since $AB = AC$, angles ABC and ACB are equal, but given they are different, verify the data.
- Confirm data consistency; in this case, the given angles suggest that only angle BAC is 65° .
- Alternatively, if the problem states angles ABC and ACB are 65° and 50° , then angle BAC is 65° (by the Law of Sines or geometric reasoning).

Key Takeaway: Always double-check the data and apply the triangle sum theorem carefully.
